The solution of the original equation is the number -3; however, the answer is often displayed in the form of the equation $x = -3$. Since each equation obtained in the process is equivalent to the original equation, -3 is also a solution of $2x + 1 = x - 2$.

To solve for $P = p^3(p + q) = p$. We combine the P's together $p - p^3 - p = q$. The $p = 3/2q$. The correct answer is D. 2. To solve for b when the value of $a = 3$. $4a = 2b - 7$. we put 3 where there is a.

$p^7 + p^5$ (d) (0:029) $1=3$ (e) $\tan 22:5$ Solution (a) $\cos(\) = 4\cos^3$ $3\cos^3$, therefore it's constructible if \cos is. (b) $3q^258 = 3p^252$. If it were constructible then so would be $3p^25$ which is a root of $x^3 - 25 = 0$. This is a cubic polynomial with rational coefficients. If it has a constructible root it must have a rational root which has to be an integer dividing 25.

Such a solution is called a general solution of the differential equation. It is a general form of a set of infinitely many functions, each differs from others by one (or more) constant term and/or constant coefficients, which all satisfy the differential equation in question.

The solution $y \equiv 1 \pmod{p}$ leads to the linear congruence $12x \equiv -4 \pmod{p}$. Since $(12,p) = 1$, this congruence has a solution. It therefore follows that the congruence $6x^2+5x+1 \equiv 0 \pmod{p}$ also has a solution. (2) Show that 3 is a quadratic residue modulo 23, but is a non-residue modulo 31.
