Review Chemical Bonding Section 5

Why do some atoms join together to form molecules, but others do not? Why is the CO₂ molecule linear whereas H₂O is bent? How can we tell? How does hemoglobin carry oxygen through our bloodstream?

Chemical Bonding and Molecular Structure

Chemical Bonding. Chemical compounds are formed by the joining of two or more atoms. A stable compound occurs when the total energy of the combination has lower energy than the separated atoms.

Metallic bonding is a type of chemical bonding that rises from the electrostatic attractive force between conduction electrons (in the form of an electron cloud of delocalized electrons) and positively charged metal ions. It may be described as the sharing of free electrons among a structure of positively charged ions (). Metallic bonding accounts for many physical properties of metals, such as ...

The process of bonding and grounding can be defined as providing an electrically conductive pathway between a dispensing container, a receiving container and an earth ground. This pathway helps eliminate the buildup of static electricity by allowing it to safely dissipate into the ground. Both the National Fire Protection Association (NFPA) and the Occupational Safety and Health Administration ...

Here's the long-awaited, uncensored inside story from the "thought criminal" himself—Germar Rudolf. Rudolf was a highly respected chemist with a promising career—a graduate of the Max Planck Institute—who made the "mistake" of telling the truth at a place (Germany) and time (during court) when lies are the only permissible public statements about the Holocaust.
