The physical properties of soils, in order of decreasing importance for ecosystem services such as crop production, are texture, structure, bulk density, porosity, consistency, temperature, colour and resistivity. Soil texture is determined by the relative proportion of the three kinds of soil mineral particles, called soil separates: sand, silt, and clay.

Geotechnical engineering is the branch of civil engineering concerned with the engineering behavior of earth materials. Geotechnical engineering is important in civil engineering, but also has applications in military, mining, petroleum and other engineering disciplines that are concerned with construction occurring on the surface or within the ground.

Helical piles are an increasingly popular and remarkably effective deep foundation option. Each helical pile is composed of a steel pipe shaft with a 45° cut at the bottom and one or more formed helical plates welded outside.

Project Education | Almita Piling

Bearing piles are required when a structure cannot be founded on a shallow foundation. Tall structures, for example, often require deep foundations based on engineering principles.

The intent of this material is to communicate the best practices for design of Segmental Retaining Walls (SRW) as determined by Allan Block Corporation based on 25 plus years of research, design and field experience. This is not meant to be a final authority as each project has its own set of unique situations.

Waterproofing DMX AG™ isolates these cracks and capillaries from the surrounding wet soil, to prevent this from happening, and provides a clear negative side drainage path for ground moisture to be redirected to the footing drains, eliminating lateral water flow into the basement.
